Overlaying and registering interactive virtual content on the real world requires sophisticated hardware and advanced software: cutting-edge optics, state-of-the-art sensors, and the latest in computer vision and computer graphics algorithms. Meta 2 provides an easy-to-use platform for creating augmented reality applications that abstracts these complexities.

This presentation builds an interactive augmented-reality application with Meta 2, live on stage in minutes. It demonstrates a content-creation workflow that no longer only exists in a panel, but lives within our world, where we can directly engage it with our hands.
